API PARTNER BRIEFING

Upcoming Change — Ultimate Beneficial Owner (UBO) Capture

Corporate Client Journeys — Motor

Purpose of this briefing: to give you early notice of an upcoming regulatory project that will require changes to your front-end system. From go-live, corporate client journeys will need to capture Ultimate Beneficial Owner (UBO) details before a quotation can be issued and before a purchase can be confirmed. This document explains what you need to build and how it affects the insurance journey. A detailed API specification will follow separately.

1. Why This Is Happening

Bank Negara Malaysia (BNM) requires insurers to perform sanction screening not only on the contracting client, but also on the individuals who ultimately own or control a corporate client — the Ultimate Beneficial Owners (UBO).

To meet this obligation, Chubb is enhancing its systems to retrieve, capture and screen UBO details for all corporate policies. Because a significant volume of corporate business is transacted through partner front-end systems, partners will need to make corresponding changes to capture and pass these details. Without them, the transaction cannot proceed to quotation or to policy issuance.

At a Glance	Summary
What is changing	Corporate client journeys must capture UBO details — auto-populated from the Chubb API response where available or entered manually by the user where not.
Who is affected	Corporate / company client journeys only, for Motor. Individual client journeys are NOT affected.
When it applies	Two points in the journey: before quotation issuance (if applicable), and again before Confirm Purchase where the customer returns after a break.
What partners must do	Enhance the front-end system to display, capture and pass UBO details, including a manual-entry path and validation that blocks progression without them.
Impact if not done	Corporate transactions submitted without UBO details will not be able to proceed to quotation or policy issuance from go-live.

2. What You Need to Build

The following changes are required in your front-end system for corporate client journeys.

#	Requirement
1	Add a UBO section to the corporate client journey, capable of holding multiple UBO records — a minimum of 1 and a maximum of 4.
2	Consume the UBO details returned in the Chubb API response and AUTO-POPULATE them into the UBO section for the user to review.
3	Where the API response contains NO UBO details, PROMPT the user to enter the UBO details manually.
4	Enforce the mandatory fields for every UBO record — Name, IC / Passport and Country. The user must not be able to proceed without them.
5	Pass the captured UBO details back to Chubb so that they can be included in sanction screening.
6	Call the Chubb API again to REFRESH the UBO details before Confirm Purchase where the customer has returned after a break in the journey, and capture / overwrite with the refreshed details.
7	Where the refresh returns no details, RETAIN and proceed with the UBO details captured earlier at quotation stage.

Key rule: UBO details are mandatory. Whether they arrive from the API or are typed in by the user, the journey must not be allowed to continue without a minimum of 1 complete UBO record.

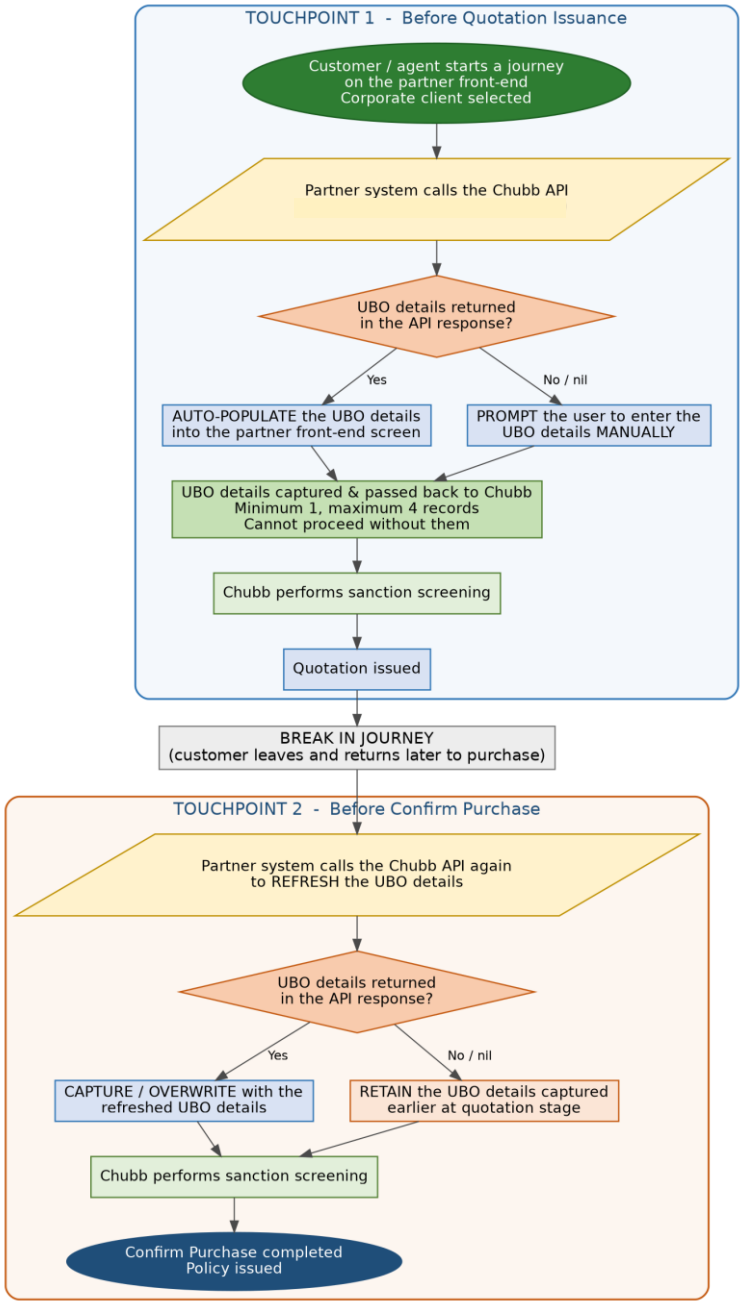

3. UBO Fields to Capture

These fields apply to each UBO record captured (minimum 1, maximum 4 records per corporate client).

Field	Mandatory?	Notes
Name	Mandatory	Full name of the individual beneficial owner.
IC / Passport	Not mandatory	Identity card number for local individuals; passport number for foreign individuals.
Country	Not mandatory	Refer to Section 7 — exact definition and format to be confirmed in the API specification.
Date of Birth (DOB)	Not mandatory	Captured where available.
Address	Not mandatory	Captured where available.

4. Where This Fits in the Journey

UBO details are required at two points in the corporate client journey. The diagram below shows both.

UBO capture at Touchpoint 1 (before quotation) and Touchpoint 2 (before Confirm Purchase after a break)

Touchpoint 1 — Before Quotation Issuance

Step	What Happens
1	The user selects a corporate client and the journey calls the Chubb API.
2	If UBO details are returned, your system auto-populates them into the UBO section.
3	If no UBO details are returned, your system prompts the user to enter them manually.
4	The UBO details (minimum 1, maximum 4) are captured and passed back to Chubb.
5	Chubb performs sanction screening. If clear, the quotation is issued.

Touchpoint 2 — Before Confirm Purchase (after a break in the journey)

Where the customer leaves after the quotation and returns later to complete the purchase, the UBO details must be refreshed before Confirm Purchase — they may have changed in the interim.

Step	What Happens
1	Your system calls the Chubb API again to refresh the UBO details.
2	If UBO details are returned, capture / overwrite the previously held details with the refreshed set.
3	If NO details are returned, retain and proceed with the UBO details captured earlier at quotation stage.
4	The UBO details are passed to Chubb and sanction screening is performed again before the purchase is confirmed.

5. Impact on the Insurance Journey

What this means in practice for your users and your customers.

Area	Impact
Corporate journeys	An additional data-capture step is introduced before quotation. Where the API returns UBO details, this is largely a review step; where it does not, the user must key in the details before continuing.
Individual journeys	No impact — no UBO capture and no change to the existing journey.
Journey completion	Corporate journeys can no longer be completed without UBO details. Users who cannot supply them will be unable to obtain a quotation or confirm a purchase.
Returning customers	Where a customer returns after a break to complete a purchase, a refresh call is made and the UBO details may be updated — the user may see details that differ from those shown at quotation stage.

What Is NOT Changing

- Individual (non-corporate) client journeys — no change at all.
- The existing quotation and purchase flow structure — UBO capture is added into the current journey, not a redesign of it.
- Sanction screening itself — this remains performed by Chubb; partners are not required to perform any screening.

6. What We Need From You

#	Action	Timing
1	Confirm receipt of this briefing and nominate a technical and a business contact for this project.	To be agreed
2	Review the API specification once issued and confirm feasibility of the required front-end changes.	On receipt of spec
3	Provide an indicative development and testing estimate, and confirm your target readiness date.	To be agreed
4	Participate in integration testing / UAT with Chubb ahead of go-live.	To be scheduled
5	Raise any constraints in your UI journey early — particularly where the manual-entry prompt or the refresh step may be difficult to accommodate.	As soon as identified

On UI design: the placement and design of the UBO fields within your journey is yours to determine — we are specifying what must be captured and when, not how your screens should look. We ask only that the mandatory-field and manual-entry rules in Sections 2 and 3 are met.

Next Steps

We will circulate the detailed API specification, followed by a technical walkthrough session for partner development teams.
